MODELLING RESULTS

MODELS	RMSE	MAE	MSE	FCP
SVD	1.37	1.10	1.88	0.54
KNN BASELINE	1.40	1.13	1.96	0.55
KNN WITH MEANS	1.50	1.16	2.26	0.71
KNN WITH Z-SCORE	1.51	1.16	2.27	0.71
NMF	1.58	1.26	2.50	0.57
KNN BASIC	1.62	1.27	2.62	0.59

RMSE → measures accuracy of predicted ratings

MAE → measures average magnitude of prediction errors

MSE → measures average squared difference b/w predicted and actual ratings
**FCP** → measures the system's ranking accuracy

RMSE → used for selecting the final model

Ratings accuracy important for predicting unknow ratings

SVD was the best performing algorithm for RMSE, MAE and MSE

SVD used in conjunction with **collaborative filtering**

RECOMMENDATION SYSTEM RESULTS

- Original liking for Self-Help, Fantasy, Fiction, Romance

- Fantasy, Thriller, Fiction, and Adventure genres recommended

- Fiction Recommendations line up with liking for Hobbit and Lord of the Rings

- Popular titles recommended in similar genres

- There is a shift in genres and themes

- Popular titles not already reviews might be because of either missing data or book-based movies

- Eases into exploration of other genres and themes

- Identified widely recognized books that have the potential to engage and captivate readers

CONCLUSION

- Ratings are subjective to user preferences

- Divergence of genres and themes can be good or bad

- Not enough information available to determine user personas

- Accuracy range of 1.3 rating points is still high

- No way to predict how may books a user will keep

- No solution for a new user with no data

NEXT STEPS & IMPROVEMENTS

- Higher Granularity and features for user and product personas

- Have more data for bad ratings

- Further modelling to bring accuracy close to 0.5 rating points

- Improve Sampling Methods to increase amount of training data

- Use hybrid approach to collaborative filtering

- Incorporate solution for cold start problem
